Vljudno vabljeni!

Abstract:

Online apps for preventive conservation are proliferating in the web. For free and with a few clicks it is possible to analyse humidity and temperature data, estimate pollutant concentration indoors, predict dust deposition rates, and many other tasks, basic and advanced. Current research projects (such as the developments around IPERION-HS and ERIHS, the European Research Infrastructure for Heritage Science) will accelerate the creation of new online platforms and improve their capabilities. In this talk, I will provide an overview, with practical demonstrations, of some of the best available online tools, and present a blueprint for future developments.
